

Truck Photography Tips

A short guide for improving F-150 and vehicle photos - By Arnold Archaga

This PDF is a quick resource for my knowledge base section about truck photography. The goal is to keep the advice simple and useful, especially when taking photos of my F-150 or other vehicles with a phone camera.

Quick Tips

Use better lighting. Photos usually look cleaner during golden hour, early morning, cloudy weather, or right after rain. Harsh midday light can create strong shadows and blown-out highlights.

Choose a clean background. A simple background helps the truck stand out. Parking lots, open roads, empty fields, garages, or plain walls usually work better than cluttered spaces.

Try a low angle. Shooting from a slightly lower angle can make the truck look stronger and more dramatic. A front three-quarter angle usually shows the grille, side profile, and stance well.

Watch reflections and distractions. Cars and trucks reflect everything around them. Before taking the photo, check the windows, paint, and chrome for distracting reflections.

Keep the photo straight. Straighten the horizon or driveway lines so the image feels cleaner. A small tilt can make the whole photo look less polished.

Edit lightly. Small edits to brightness, contrast, shadows, and sharpness can help the photo look better, but too much editing can make the image look fake.

Simple Shot Checklist

Before Shooting	Clean the truck, check the background, and make sure there is enough light.
While Shooting	Take wide shots, close-up detail shots, low-angle shots, and front three-quarter shots.
After Shooting	Pick the clearest photos, crop distractions, straighten the image, and make light edits.

How This Connects to My Knowledge Base

This resource supports my knowledge base because it gives practical notes that can be used when planning, taking, and improving truck photos. It also works as a reusable reference that can be embedded with my own F-150 image inside the site.
